VIBE CODING

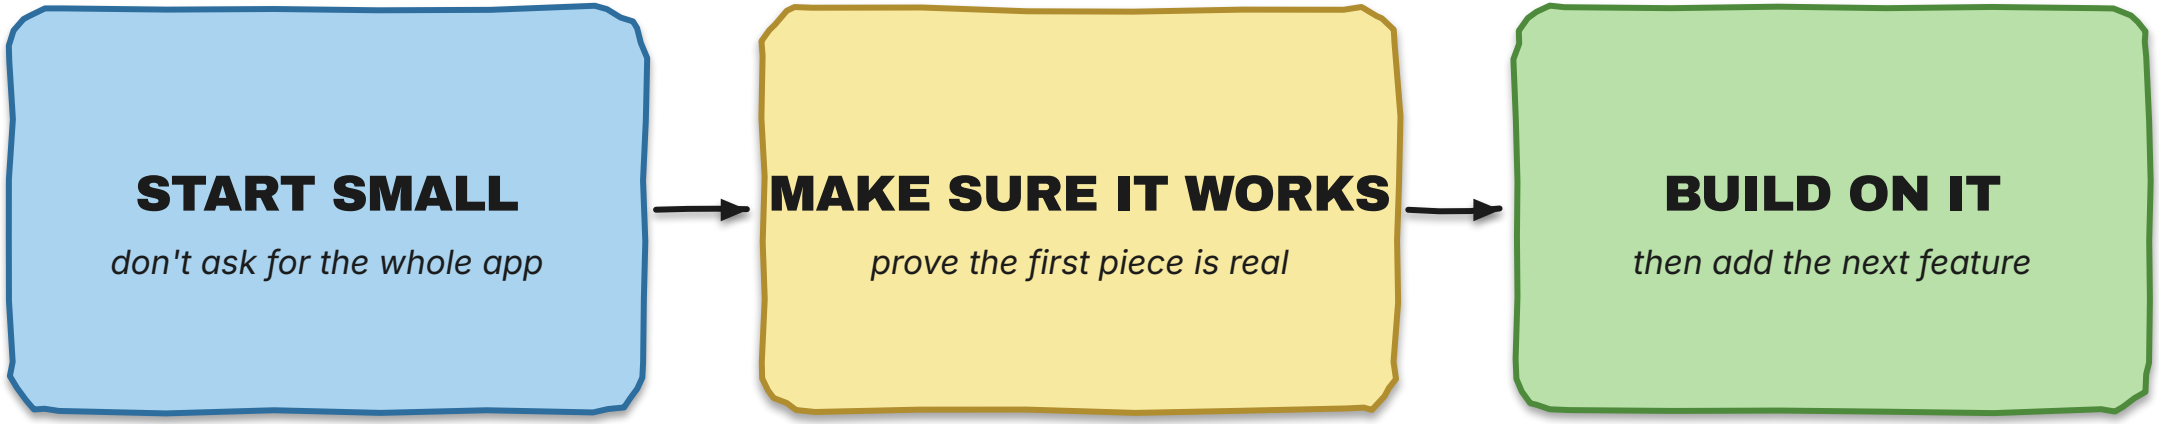

rule over AI, don't let AI rule over you.

VIBE CODING 101

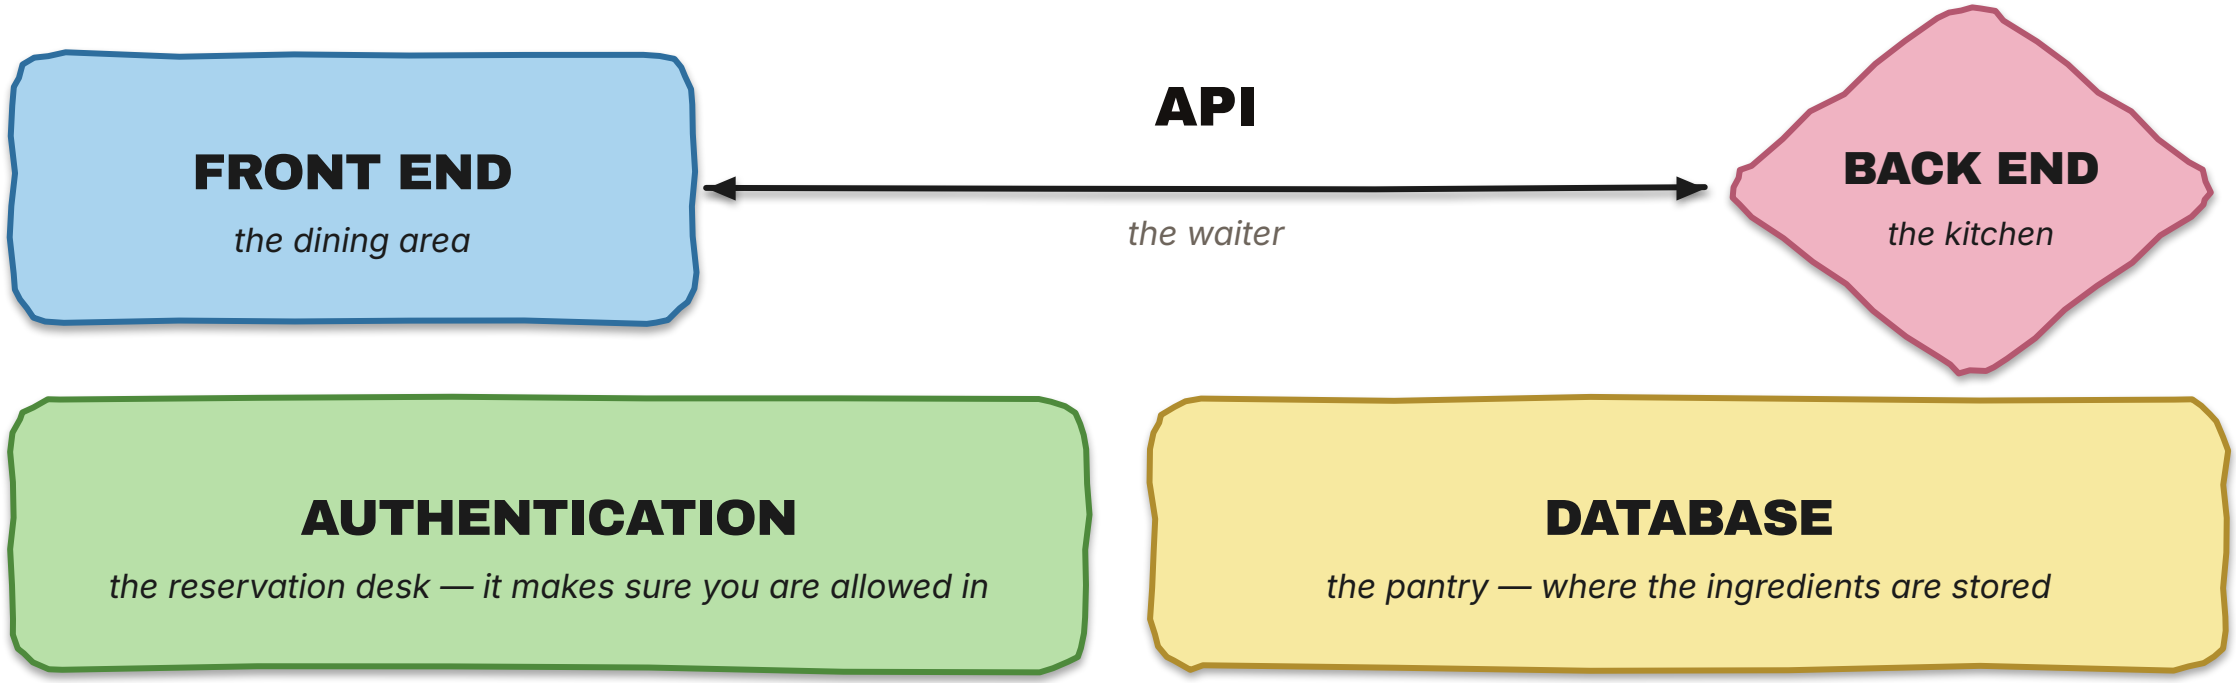

VIBE CODING

the **iterative** process of building full-fledged websites and applications without writing a single line of code yourself.

APPLICATION ARCHITECTURE

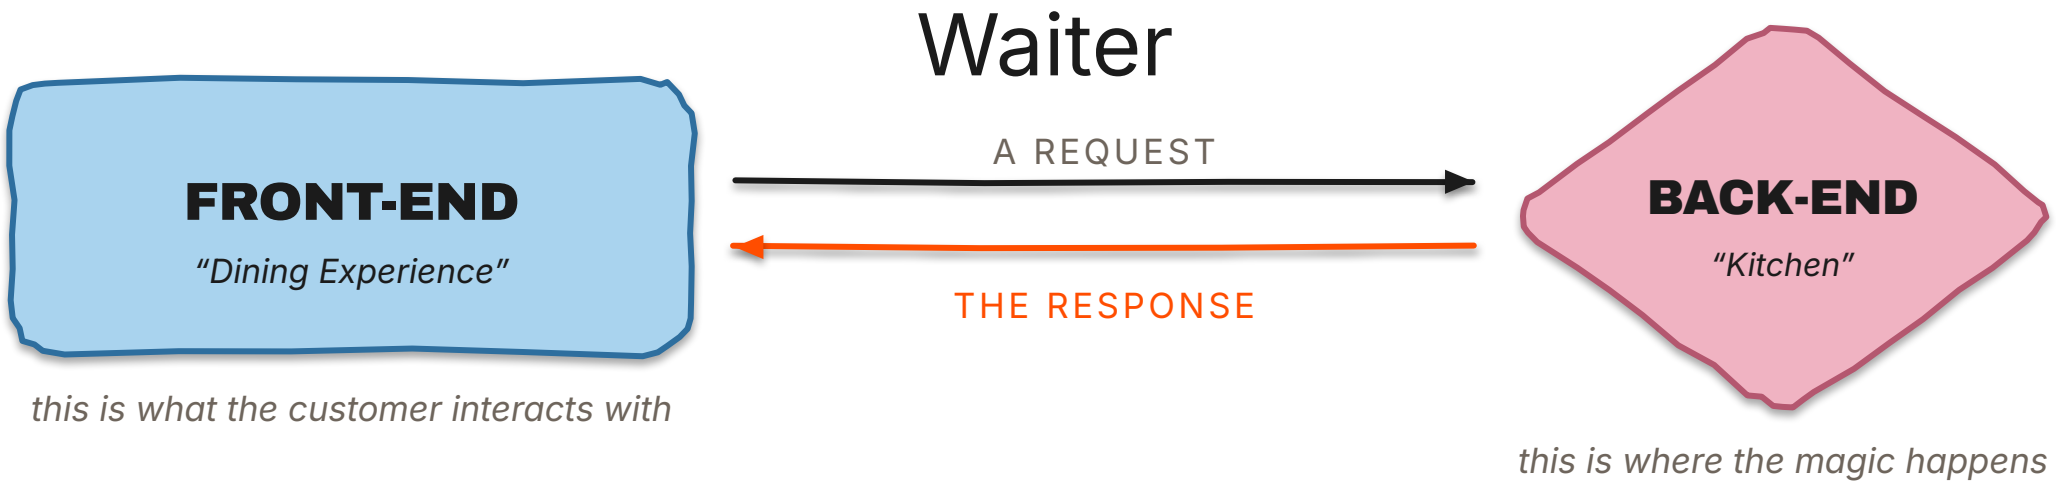

the restaurant analogy — four core pieces, and a way for them to talk.

API

APPLICATION PROGRAMMING INTERFACE

a way we can get, receive or give information in two places online — or two applications.

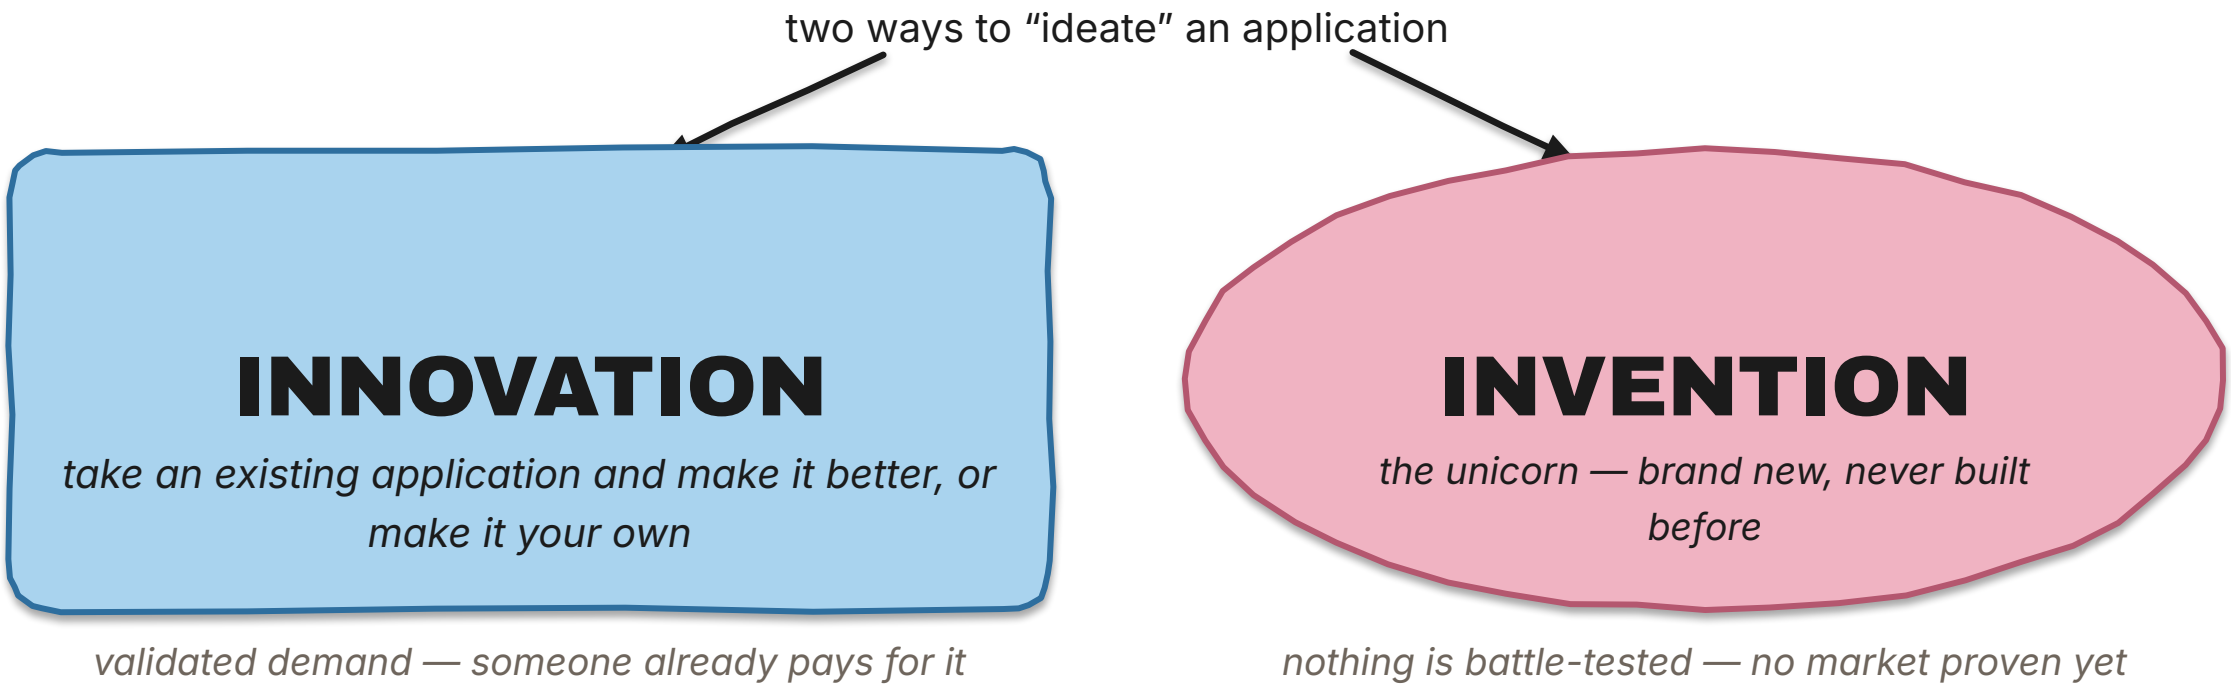

this is what the customer interacts with

this is where the magic happens

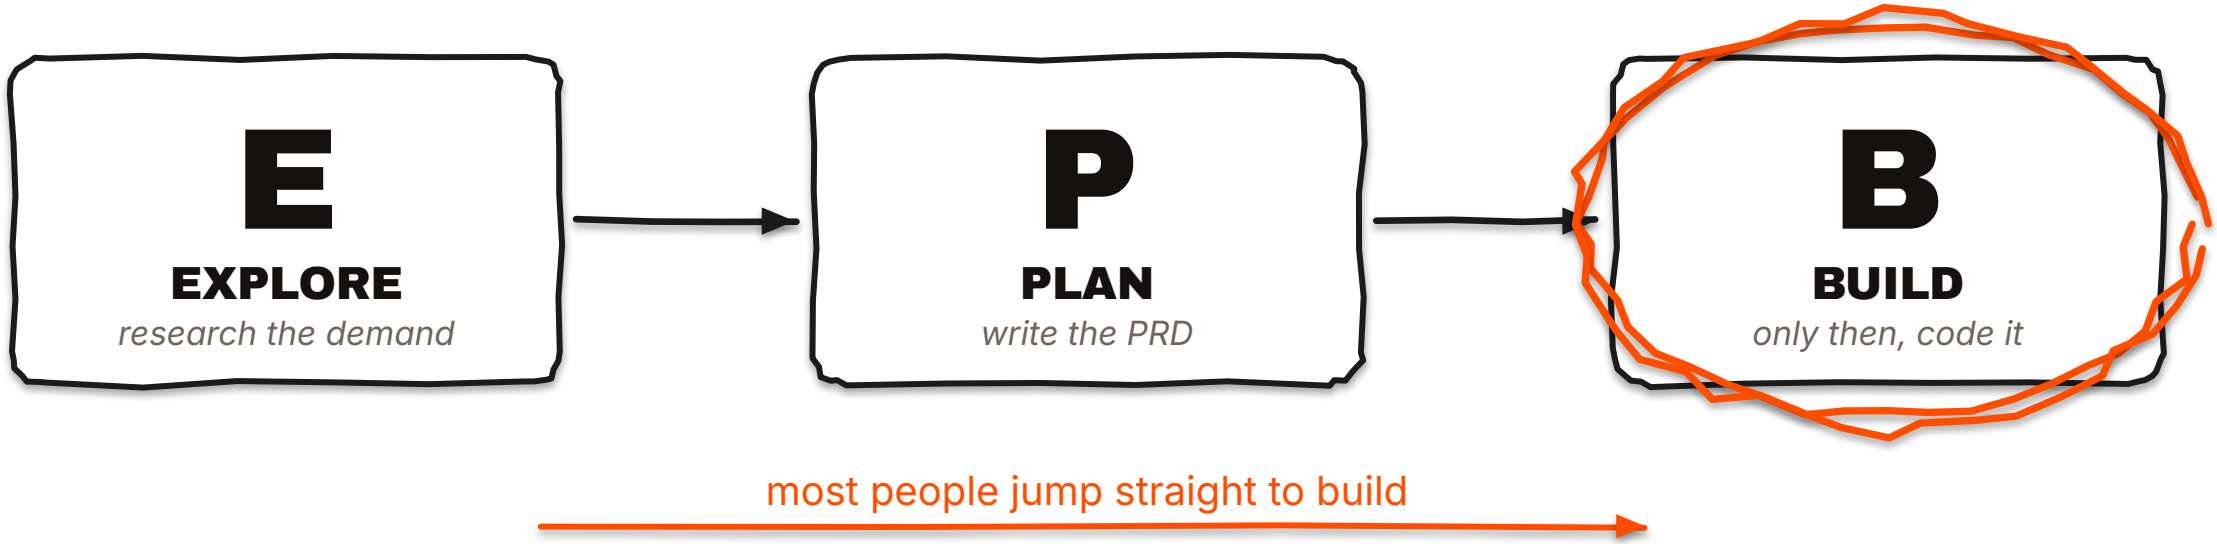

IDEATION

innovation vs. invention.

EXPLORE, PLAN, BUILD

thirty minutes in explore and plan can save thirty hours in build.

PARETO PRINCIPLE

eighty percent of users only use twenty percent of the features.

80%

of the users

20%

of the features

build the few things everyone needs — then iterate once you have feedback.

BUILD TIMELINE

the plan of record — the order you actually build in.

01 **SETUP** — architecture prompt, project structure

02 **DATABASE** — link it in Bolt

03 **BASIC USER INTERFACE**

04 **TEST THE TASK CRUD** — the gate before anything else

05 **AI INTEGRATION** — task breakdown

06 **TEAM FEATURES**

07 **AUTHENTICATION**

08 **DESIGN PASS, LANDING PAGE, PUBLISH, STRIPE**

PRD

PRODUCT REQUIREMENTS DOCUMENT

AI's language is prompting, and AI likes clear, detailed, structured prompts.

1

RAW REQUEST

where newbies live — "build me an app"

→

2

BASIC PRD

project requirements document

· task CRUD operations
· user authentication
· team collaboration
· real-time updates
· kanban board view

→

3

PLATFORM-OPTIMIZED

build a task management app:

✓ React with TypeScript
✓ Tailwind CSS styling
✓ Supabase auth & real-time DB
✓ shadcn/ui components
✓ Drag-and-drop with dnd-kit
✓ Responsive mobile-first design

DATABASE

a table with rows and columns, like an Excel or Google Sheet.

DATABASE

the pantry — where the ingredients are stored

ID	NAME	STATUS
1385jg_k	Meeting Jeff	open
135788ab	Launch week	doing
9f21c7e0	Design pass	done

CRUD

before anything else, the task CRUD must work — the four operations you test first:

C **CREATE** — new information that did not exist before

R **READ** — viewing information that exists, on screen or in the database

U **UPDATE** — editing existing information — like changing a username

D **DELETE** — bon voyage, hasta la vista

WHERE AI MODELS LIVE

two places — one is theirs, one is yours.

1

THE MODEL MAKER'S APP

ChatGPT — where most people first used GPT models

2

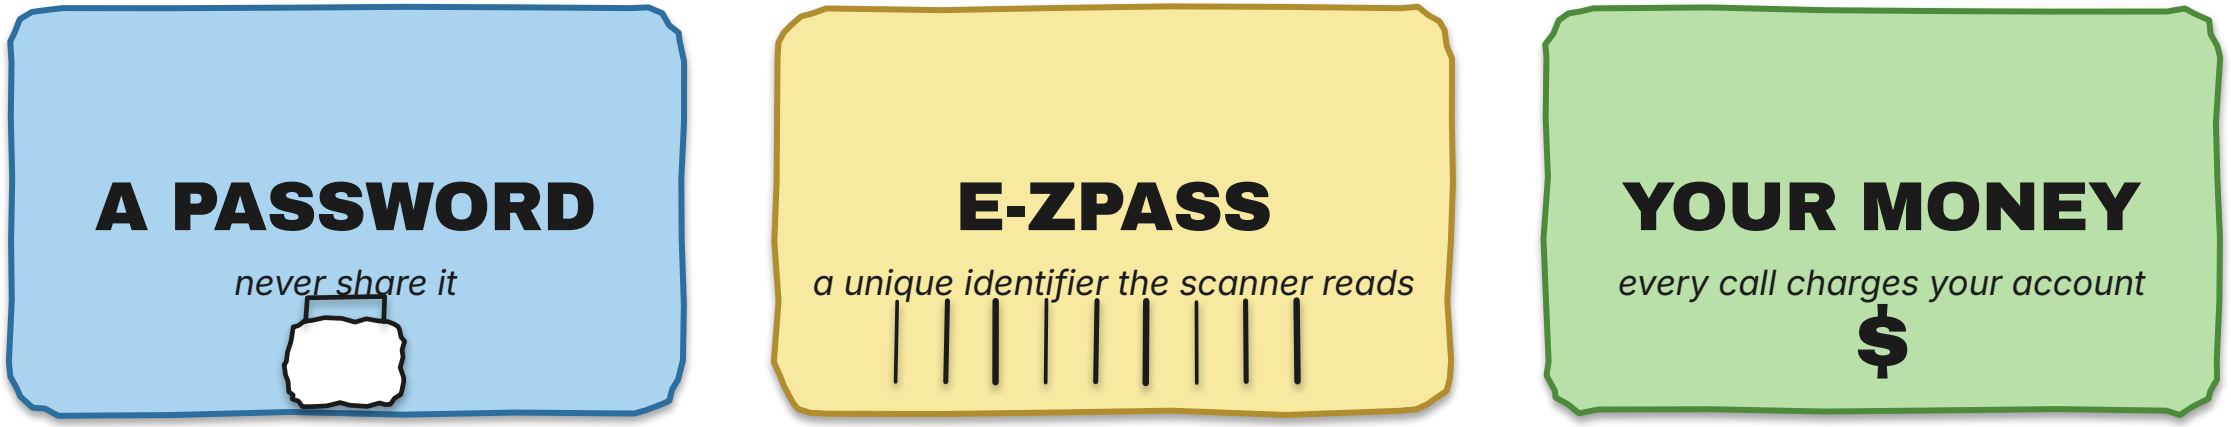

THE OPENAI API

where you use those models inside your own application

the api is the highway — you send a prompt, you get a response.

API KEY

how does OpenAI know you're allowed to use their models?

GETTING THE KEY

platform.openai.com → sign up, verify identity, add billing → API keys → create new secret key → name it → generate → copy and store it securely

once you hit done, you can never see it again.

SIX COMMANDMENTS

the six things that separate a build that lands from one that stalls.

01 **START WITH A PLAN** — AI can't read your mind, it can only read scripts

02 **GIVE CLEAR, SPECIFIC INSTRUCTIONS** — name the features and what they do

03 **BUILD AND TEST IN SMALL PIECES** — never pile onto an unverified foundation

04 **SAVE YOUR WORK CONSTANTLY** — version history is your rewind button

05 **DON'T PANIC — START FRESH** — the hard part isn't the how, it's the what

06 **USE THE PLATFORM'S DIALECT** — speak the way the tool wants to be spoken to

ATTRIBUTES FOR SUCCESS

you don't need to be technical. you just need to be specific.

01 **A WILLINGNESS TO LEARN**

02 **A WILLINGNESS TO WORK HARD**

03 **KNOWING YOU ARE NOT GOING TO QUIT**
